

# COMUNICARE

Care companion

## Platform

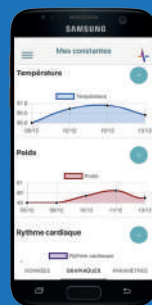

The platform aggregates information from the hospital to the patient and collects the patient outcomes for the care givers.

Comunicare's main innovation is the personalization of patient information according to the care pathway and it enables a smart interaction between the patient and his care team.

## Patient

The mobile application informs the patient about his care pathway, facilitates his therapeutic adhesion and the communication of outcomes to the medical team. The application provides access to various items of information :

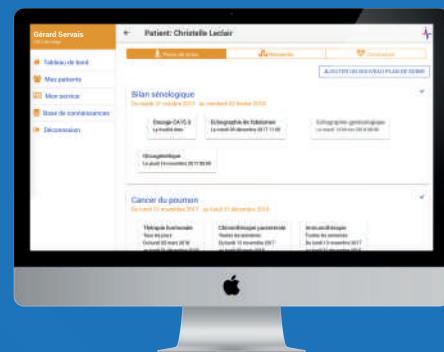

- A personalized timeline summarizing the treatment steps and care activities
- Practical knowledge on the therapy
- Didactic video clips
- Description of possible side effects

## Care givers

Comunicare collects many patients data, both physical and emotional parameters and symptoms, in order to help care team prevent potential risk situations.

A dashboard is provided to the medical team in order to access the patient's submitted data.

## Entourage

Patient's relatives and extra care actors may also be involved in the treatment process. The mobile application is versatile and allows the patient to share some information with his entourage. Thanks to the national health hubs, other care providers may also access specific data shared by the patient.
